ABSTRACT

The E-Learning Portal is a web-based application developed to bring educational resources and learning facilities together through a single interface. The portal includes sections for programming content, video tutorials, quizzes and exercises, chatbot support, FAQs, contact information and an administrative panel. Users access the application through a login workflow, while PHP session handling is used to manage access to the home page and available modules. The front end is developed using HTML, CSS, JavaScript, jQuery and Bootstrap. PHP 5.6 supports server-side processing, and MySQLi provides database connectivity for information related to users, courses, categories, quizzes, programming details, video details and FAQs. The project methodology covers requirement identification, interface development, backend implementation, database integration, module integration and functional checking. Documented screenshots and test cases demonstrate the main interfaces and navigation paths. The available project material does not include numerical performance measurements, user-survey results or measured learning outcomes; therefore, the findings are limited to implemented functionality and documented observations. Future work may include online examinations, assignment submission, learner progress tracking, discussion facilities, mobile support and cloud deployment.

Keywords: E-Learning Portal, Online Learning, Knowledge Assessment, PHP, MySQLi, HTML, CSS, JavaScript, Video Tutorials, Online Quiz.

1. INTRODUCTION

E-learning portals provide a web-based environment through which learners can access educational materials and learning activities. They can bring different resources into one place and allow students to use learning content at their own pace. Such portals can support programming education, video-based instruction and practice activities through a common interface.

The proposed E-Learning Portal is designed as a single platform for accessing programming-related content, video tutorials, quizzes and other learning-related services. It also includes login functionality, session management, chatbot and FAQ sections, and an Admin Panel. The

International Journal of Convergent Technologies and Future Systems (IJCTFS)
Website: https://www.maulikavyanshufoundation.org/IJCTFS/index.php
Email: maulikavyanshuijctfs@gmail.com | kavyanshufoundation@gmail.com
Volume 02 Issue-06 November- December 2026 ISSN NO: 3108-1312

project focuses on organizing these facilities in a web application using commonly used front-end, server-side and database technologies.

1.1 Objectives

The main objectives of the project are: (i) to develop a web-based platform that provides access to educational resources in one place; (ii) to provide programming-related learning content; (iii) to make video-based learning resources available; and (iv) to provide quiz and exercise facilities for practice and knowledge assessment.

1.2 Hypothesis

The project is based on the hypothesis that providing programming content, video tutorials, quizzes, FAQs and related facilities through one web-based platform can make learning resources more organized and convenient to access. The project examines the development and integration of these facilities; it does not claim a measured improvement in learning outcomes.

2. SYSTEM STUDY AND ANALYSIS

2.1 Problem Context

Learning resources may be distributed across different websites, documents and video services. A learner may need to move between multiple sources to find programming explanations, tutorial videos and practice material. The proposed portal addresses this organizational issue by grouping selected learning resources and services under a common navigation structure.

2.2 Existing Platforms and Project Focus

The project report identifies Moodle, Google Classroom, Coursera and Udemy as examples of existing digital learning platforms. These platforms provide context for understanding how online educational resources and activities can be organized. The present project has a narrower implementation focus: it provides selected learning sections, quiz access, chatbot and FAQ facilities through a basic web application. The source project does not contain a detailed feature-by-feature benchmark of the named platforms.

2.3 Functional Modules

The main modules documented in the project are the Login Page, Home Page, Services, Programming, Video Tutorials, Quiz/Exercise, Chatbot, FAQ, Contact Us, Works and Admin Panel. The Programming section organizes programming-related content such as Java, Android and Python. Video Tutorials provides access to programming video resources. The Quiz section allows a user to select a course and start a quiz. The Admin Panel is intended for managing courses, videos, quizzes and user-related information.

2.4 Technology Stack

The interface uses HTML and CSS for page structure and presentation, Bootstrap for responsive interface components, and JavaScript with jQuery for client-side interactions. PHP 5.6 is used for server-side processing, including login validation, session management, feedback submission and retrieval of information. MySQLi is used for database connectivity and data management. The database stores information related to login, courses, categories,

Volume 02 Issue-06 November- December 2026 ISSN NO: 3108-1312

quizzes, programming details, video details and FAQs.

3. RESEARCH METHODOLOGY

The project follows a web-application development methodology. The process begins with identifying the required learning sections and user functions, followed by interface design, backend implementation, database connection, module integration and functional checking.

3.1 Development Process

1. **Requirement Identification:** The requirements were identified around programming content, video tutorials, quizzes, chatbot access, FAQs and other learning-related services.

2. **User Interface Development:** HTML and CSS define the page structure and appearance. Bootstrap supports interface layout, while JavaScript and jQuery provide client-side interactions.

3. **Backend Development:** PHP 5.6 handles server-side operations such as login validation, session management, feedback submission and database information retrieval.

4. **Database Connectivity:** MySQLi connects the application to the database containing login, course, category, quiz, programming, video and FAQ information.

5. **Module Integration:** The home page connects the Services, Programming, Video Tutorials, Quiz/Exercise, Chatbot, FAQ, Contact Us, Works and Admin Panel sections.

6. **Testing and Verification:** Documented test cases check navigation and access to major modules, including login, programming, videos, quizzes, chatbot, FAQ, Works and the Admin Panel.

3.2 Portal Workflow

A user opens the portal in a web browser. The application starts a PHP session and checks the username session variable. If the session is not available, the user is redirected to the login page. If a valid session is available, the home page is displayed. The application retrieves relevant information from the database when required, and the user can then navigate to the available learning resources, quiz section, chatbot and other facilities.

3.3 Database and Session Handling

The application uses PHP session handling to control access to the portal. MySQLi is used by the backend to retrieve and manage application information. The documented database areas include login, courses, categories, quizzes, programming details, video details and FAQs. Detailed database schema definitions and security-test results are not included in the supplied project report.

4. SYSTEM DEVELOPMENT

4.1 Future-Ready Modular Architecture and Real-World Application

The E-Learning Portal can be further developed using a modular architecture to support future growth and real-world educational requirements.

International Journal of Convergent Technologies and Future Systems (IJCTFS)
Website: https://www.maulikavyanshufoundation.org/IJCTFS/index.php
Email: maulikavyanshuijctfs@gmail.com | kavyanshufoundation@gmail.com
Volume 02 Issue-06 November- December 2026 ISSN NO: 3108-1312

- Modular Design: The portal can be divided into separate modules such as User Management, Course Management, Video Learning, Online Quiz, FAQ, and Admin Management. Each module can be maintained and upgraded independently.
- Scalability: In the future, the system can support multiple colleges, institutions, and training centres by introducing separate user roles and institution-wise data management.
- Cloud Integration: Hosting the portal on cloud infrastructure can make learning resources accessible from different locations and support a larger number of users.
- Microservices Approach: Future versions can use microservices to manage important functionalities independently, such as authentication, course delivery, quizzes, and notifications.
- AI-Based Learning Support: An AI-based recommendation system can suggest learning materials according to students' interests, quiz performance, and learning progress.
- Real-World Application: The enhanced portal can be used by colleges, coaching institutes, and online training centres to provide centralized learning resources, conduct online assessments, and manage educational content.

This proposed architecture can transform the current E-Learning Portal into a more scalable, flexible, and institution-oriented learning platform.

4.2 Centralized Digital Learning Ecosystem

The E-Learning Portal provides a centralized digital environment where different learning resources and support facilities are available through a single web-based application.

- Centralized Access: Users can access programming content, video tutorials, quizzes, chatbot assistance, and FAQs from one platform.
- Organized Learning Resources: Different learning sections help users find relevant educational information without navigating multiple websites.
- Flexible Learning: Students can access available learning resources according to their convenience.
- Reduced Manual Effort: Digital access to educational information can reduce dependence on manually sharing learning materials.
- Educational Support: The portal provides different types of learning resources that support basic self-learning activities.

This centralized approach can be useful for colleges, training centres, and educational organizations that want to provide learning resources through a common digital platform.

6.7 Database-Driven Learning Resource Management

Database management is an important part of the E-Learning Portal because it helps store and retrieve information required by different modules.

- Database Connectivity: The application uses MySQLi to establish communication between PHP and the MySQL database.
- Information Storage: The database includes information related to login, courses, categories, quizzes, programming details, programming videos, and FAQs.
- Data Retrieval: PHP retrieves the required information from the database and displays it in the appropriate sections.

International Journal of Convergent Technologies and Future Systems (IJCTFS)
Website: https://www.maulikavyanshufoundation.org/IJCTFS/index.php
Email: maulikavyanshuijctfs@gmail.com | kavyanshufoundation@gmail.com
Volume 02 Issue-06 November- December 2026 ISSN NO: 3108-1312

- Information Organization: Different database tables help maintain learning-related information in a structured manner.
- Future Enhancement: Advanced search, filtering, database optimization, and backup facilities can be introduced to improve data management.

A well-organized database structure can support future expansion of the portal and help manage increasing educational information.

6.8 Session-Based User Access Control

User access management is an important aspect of web-based applications. The E-Learning Portal uses PHP session management to check the login status of users.

- Login Verification: The login process checks the submitted user information through the validation functionality.
- Session Management: PHP sessions are used to maintain the user's login state.
- Access Restriction: If the username is not available in the session, the application redirects the user to the login page.
- Controlled Navigation: Session checking helps prevent direct access to protected pages without an available login session.
- Future Enhancement: Stronger password protection, role-based permissions, secure session handling, and additional authentication methods can be introduced.

These improvements can make the portal more suitable for handling different types of users, such as students, teachers, and administrators.

6.9 Multi-Institution Learning Platform

The current E-Learning Portal can be extended into a multi-institution learning platform that supports different educational organizations through a common system.

- Multiple Institutions: Different colleges, schools, and training centres could use the same platform.
- Separate Data Management: Each institution could maintain its own student information, courses, and learning materials.
- User Roles: Separate access permissions could be provided for students, teachers, and administrators.
- Institution Management: Administrators could manage educational content and user activities for their respective institutions.
- Scalable Structure: A suitable database architecture could help support additional institutions as the system grows.

This proposed approach can be useful for educational organizations that want to manage digital learning resources through a shared platform while keeping their institutional information separate.

6.10 AI-Based Personalized Learning Support

Artificial Intelligence can be introduced in future versions of the E-Learning Portal to provide a more personalized learning experience.

- Smart Recommendations: The system could recommend programming topics and learning materials according to students' interests.

International Journal of Convergent Technologies and Future Systems (IJCTFS)
Website: https://www.maulikavyanshufoundation.org/IJCTFS/index.php
Email: maulikavyanshuijctfs@gmail.com | kavyanshufoundation@gmail.com
Volume 02 Issue-06 November- December 2026 ISSN NO: 3108-1312

- Performance Analysis: Quiz results could be analysed to identify topics in which students need additional practice.
- Intelligent Chatbot: An advanced chatbot could provide answers to common academic questions and guide users towards relevant learning resources.
- Personalized Learning Path: Students could receive suggested learning sequences based on their learning progress.
- Automated Assistance: AI-based support could help users find relevant educational information more easily.

The integration of AI technologies could transform the portal from a basic learning-resource platform into a more adaptive and interactive learning environment.

6.11 Cloud-Based E-Learning Infrastructure

Cloud computing can be considered as a future deployment approach for making the E-Learning Portal accessible to users from different geographical locations.

- Remote Accessibility: Students and teachers could access the portal through internet-connected devices.
- Flexible Hosting: The application could be hosted on cloud infrastructure instead of depending only on a local development environment.
- Data Backup: Cloud-based backup facilities could help protect important educational information.
- Resource Expansion: Hosting resources could be increased according to the number of users and application requirements.
- Future Integration: Cloud services could support additional facilities such as online examinations, notifications, and digital content management.

Cloud deployment can improve the accessibility and expansion possibilities of the portal, provided that suitable security and infrastructure configurations are implemented.

6.12 Modular Architecture and Future System Expansion

A modular architecture can help organize the E-Learning Portal into separate functional components. Each module can perform a specific responsibility and can be enhanced independently.

- User Module: Manages login-related activities and user access.
- Programming Module: Provides programming-related learning information.
- Video Module: Provides access to video-based learning resources.
- Quiz Module: Supports quiz-based practice and knowledge assessment.
- FAQ and Chatbot Modules: Provide basic user assistance and access to frequently asked questions.
- Admin Module: Supports administration-related activities.

In future development, these modules could be organized using a layered architecture consisting of the Presentation Layer, Business Logic Layer, and Data Access Layer. A service-based or microservices architecture could also be considered if the application grows and requires independent deployment of different services.

International Journal of Convergent Technologies and Future Systems (IJCTFS)

Email: maulikavyanshuijctfs@gmail.com | kavyanshufoundation@gmail.com
Volume 02 Issue-06 November- December 2026 ISSN NO: 3108-1312

A modular structure can improve maintainability, simplify future modifications, and support the gradual addition of new functionalities.

6.13 Real-World Applications of the E-Learning Portal

The E-Learning Portal has potential applications in different educational environments.

- Colleges and Universities: Institutions could provide programming resources, video tutorials, and practice quizzes to students.
- Coaching Institutes: Training centres could organize subject-related learning materials and practice activities.
- Technical Training Centres: Programming and technical learning content could be made available through a centralized portal.
- Self-Learning: Individual learners could use the available resources for independent learning and practice.
- Educational Administration: Future administrative features could help institutions organize users and learning-related information.

With further development, security improvements, and proper testing, the portal could be extended into a useful digital learning solution for different educational environments.

5. DIGITAL CONTENT MANAGEMENT AND KNOWLEDGE SHARING

Digital content management plays an important role in an online learning platform. The E-Learning Portal provides a common environment for organizing and accessing different types of educational resources.

- Centralized Content Organization: Learning-related information is presented through separate sections such as Programming, Video Tutorials, Quiz, and FAQs.
- Easy Knowledge Access: Users can access available educational content through the portal without depending entirely on traditional printed materials.
- Multiple Learning Formats: The portal provides programming information, video-based resources, and quiz-based practice to support different learning activities.
- Knowledge Sharing: The platform creates an opportunity to make educational resources available to users through a common web application.
- Content Administration: The Admin Panel provides an administration-related area for managing portal activities.
- Future Improvement: Content categorization, advanced search, downloadable study materials, and content update facilities can be considered to improve the learning experience.

Digital content management can help educational institutions organize learning resources systematically and make knowledge more accessible to students.

Volume 02 Issue-06 November- December 2026 ISSN NO: 3108-1312

6. END-TO-END SYSYTEM WORKFLOW AND NAVIGATION

The E-Learning Portal follows a structured workflow that allows users to access different learning facilities through a common interface. The system connects login functionality, session management, navigation, and database-related operations.

- User Login: Users enter their login details through the Login Page. The submitted information is processed through the validation functionality.
- Session Verification: PHP session management checks whether the username is available in the session before allowing access to the Home Page.
- Main Navigation: The Home Page provides navigation to different sections, including Services, Programming, Video Tutorials, Chatbot, Works, FAQs, and Contact Us.
- Learning Activities: Users can explore programming content, access video tutorials, and practise through the Quiz section.
- Information Retrieval: The FAQ section retrieves frequently asked questions from the database using PHP MySQLi.
- User Assistance: The Chatbot section provides an additional interface for user interaction.
- Logout Process: Users can end their session through the Logout functionality.

This structured workflow connects different modules of the application and provides an organized way for users to access available learning resources. It also creates a foundation for adding more educational services in future versions.

7. RESULTS AND ANALYSIS

The implementation resulted in a web-based portal that brings several learning resources and services together through one interface. The documented modules include Login, Home Page, Services, Programming, Video Tutorials, Quiz, Chatbot, Works and Admin Panel. The screenshots in Figures 1–7 show the login and home pages, service cards, programming content, a video tutorial card, quiz access and the chatbot interface.

The login page provides an entry point to the application, and PHP session management checks whether a user session is available. The home page provides navigation to the portal sections. Programming and Video Tutorials organize learning content, while the Quiz section provides a course-selection interface and a control to start a quiz. The chatbot section presents a chat interface. The project report also documents FAQ retrieval through PHP and MySQLi and an administrative interface for managing courses, videos, quizzes and user-related information.

The original project report records test cases for session checking, login form submission, navigation to programming and video tutorial pages, quiz access, chatbot access, FAQ retrieval, Works images and the Admin Panel. These observations support the presence of the documented interfaces and functional paths. However, the available material does not provide numerical performance measurements, user-survey results, sample sizes or measured changes in learning outcomes. Accordingly, no quantitative claim about system effectiveness is made.

International Journal of Convergent Technologies and Future Systems (IJCTFS)
Website: https://www.maulikavyanshufoundation.org/IJCTFS/index.php
Email: maulikavyanshuijctfs@gmail.com | kavyanshufoundation@gmail.com
Volume 02 Issue-06 November- December 2026 ISSN NO: 3108-1312

8. CRITICAL ANALYSIS AND DISCUSSION

8.1 Strengths

The portal provides a common location for selected learning resources; includes programming content, video tutorials and quizzes; offers chatbot and FAQ support; and provides a simple navigation structure. Database connectivity and an Admin Panel are also included in the documented system.

8.2 Limitations and Risks

The current project report does not document advanced learning facilities such as online examinations, assignment submission or learner progress tracking. The application uses PHP 5.6, which is an older technology version and should be considered for upgrade during future maintenance. Although login and session management are described, detailed security implementation and security testing are not sufficiently documented. The project also lacks quantitative performance evaluation and user-study evidence.

8.3 Recommendations

Recommended improvements include upgrading PHP to a currently supported version; strengthening authentication, session handling and data protection; adding and maintaining more programming courses and video resources; improving the interface for different device sizes; conducting functional, security and performance testing; and maintaining accurate database information. Additional learning facilities can be introduced to make the portal more interactive.

8.4 Future Scope

Future development may include online examinations, assignment submission, student progress tracking, discussion forums, notifications, mobile application support, AI-based recommendations and cloud deployment. These are proposed enhancements and are not presented as features already implemented in the current version.

9. CONCLUSION

The Design and Development of an E-Learning Portal for Online Learning and Knowledge Assessment presents a web-based approach for organizing selected educational resources through a single application. The portal combines login and session handling with programming content, video tutorials, quizzes, chatbot support, FAQs and administrative facilities. It is developed using HTML, CSS, JavaScript, jQuery, Bootstrap, PHP 5.6 and MySQLi.

The documented screenshots and test cases demonstrate the main interfaces and navigation paths of the implemented modules. The project provides a useful foundation for a centralized online learning platform. At the same time, the available evidence is limited to implemented functionality and documented test observations; it does not establish measured improvements

in learning outcomes or numerical system performance. Future work should focus on technology upgrades, stronger security, expanded learning features and structured evaluation.
